

## Introducing ClipOn from Niftylift:

A simple, easy-to-use, retrofittable safety device that provides Niftylift operators with a visual and audible reminder to connect their harness

### How does it work?

ClipOn provides a visual and audible warning if a person tries to operate the Niftylift without clipping on their safety harness to one of the machine's harness points.

When the machine is switched on, Red LEDs above each harness point indicate that no harness lanyard is attached.

If the operator tries to activate the machine using the footswitch, an audible alarm will sound as an additional indication/reminder.

The LED will change to green as soon as a harness lanyard is attached, and the alarm will stop sounding.

The green light under the cage clearly indicates to the ground team the status of the operator harness attachment, improving site safety compliance.
